Hog Slaughter Now Back to Levels Implied by the December 'Hogs and Pigs' Report. All eyes on the results of March survey, to be released March 30.

Cash hog prices have been drifting lower in recent days following the sharp run-up in price during February. The IA/MN negotiated base price last night was quoted at \$66.10/cwt, \$1.3 lower than the previous day and \$2.4 lower than where it was at the start of the month. For the last three weeks, the IA/MN negotiated base has averaged around \$67.8/cwt, reflecting

a somewhat more stable market and in line with what we normally see at this time of year. The chart to the right shows the 1 day cash hog index, calculated using the CME methodology. The index is nothing more than a weighted average of the net prices for hogs traded either on a negotiated basis or on a pork/swine market formula basis. The key word here is net rather than base, which is why the last index value is around \$71.95/cwt. The net price includes various premiums over the base that packers pay to producers for meeting performance goals. You will notice

that both the cash hog index chart and the pork cutout chart show 2012/2013 and 2016/2017. We decided to leave out 2014 and 2015 which were significantly impacted by the spread of PEDv and its aftermath. Lean hog and pork cutout prices so far have been trending above the levels we saw a year ago even as pork production is about 3% higher than last year. As we have noted before, hog slaughter in February was a touch under what was implied in the latest Hogs and Pigs report but generally hog numbers have been consistently above year ago levels while hog weights have been modestly under the levels we saw last year. We don't find the lower weight numbers particularly surprising, after all the barns are full and the market has provided an incentive for producers to market their hogs as soon as they can. The true surprise is how resilient pork demand has been, with pork exports certainly providing a much needed lift. The weekly pork export data released this morning continued to show that pork exports remain in excellent shape. The last official monthly pork trade data pegged January shipments at 457.9 million pounds on a carcass weight basis, 19.6% higher than the previous year. Based on the weekly export shipments we calculate that pork exports in February were around 445 to 450 million pounds, 16% higher than last year and March at this point is on track to be over 500 million pounds, +17% higher than a year ago. The increase in pork exports has absorbed much of the increase in pork production so far and helps explain why pork prices are holding together so far.

Pork packer margins also remain in good shape. On the next page we show the spread between the cutout and the hog carcass price, also referred to as the meat spread and seen as a broad indicator of packer margins. Keep in mind that to calculate the full gross margin one also needs to account for drop credits and those credits today are about \$4.8/head higher than they were a year ago. In other words, as good as packer margins were in March/April of 2016, today they are even better. Futures markets are currently pricing summer hogs around \$78/cwt, which would imply a pork cutout in the high 80s (if we follow last year's trends). The key to break above such levels would be robust pork export demand and higher prices for competing meats. The risk to the downside, in our opinion, would come from much larger than expected supplies (keep an eye on the inventory report March 30)

and any issues that may develop with major trading partners (remember Mexico is 30% of pork trade).

2. Sharp increase in beef values should be supportive for pork going into the grilling season

The volume of choice beef sold in the spot market was particularly light in the last few days even as steer/heifer slaughter remains well above year ago levels. Each day USDA reports on the number of choice, select and grinds that are sold in the spot negotiated market. Last week, the average daily spot loads sold was a mere 56.6 loads per day, 12.8% lower than what it was a week ago and 20% lower than what it was in early February. And yet, steer and heifer slaughter for the week (choice beef will come from these animals) was estimated at 465,000 head, slightly higher than what it was the previous week and 1.5% higher than in early February. The chart below shows the relationship between fed cattle prices and the cutout. Prices tracked pretty close with one another in 2013-2015, effectively implying very tight packer margins. The

situation shifted in late 2015 and 2016 as increasing cattle supplies and reduced packing capacity provided beef packers/processors with more leverage. What is striking in the chart on page 1 is that a) packers continue to maintain their margins as evidenced by the large spread between cutout and cattle prices and b) fed cattle futures still are pricing a deep discount for the summer and fall.
